# Ladění výpočetní knihovny napsané v jazyce C prostřednictvím MATLABu

**Martin Šiler**

Akademie Věd ČR, Ústav přístrojové techniky  
Královopolská 147, 612 64 Brno

### Proč:

- Překonat omezení
- Slabý hardware (Arduino), real-time, složité a náročné
- CUDA - explicitně

```
cdecl
c gibberish ↔ English
int (*)(foo)(void))[3]
declare foo as pointer to function (void) returning pointer to array 3 of int
```

`malloc(), ..., free()`

### Cena:

- Složitost
- Práce s pamětí
- Debugování a ověření správnosti

Náš problém:

# Zobrazování pomocí optických vláken

## Co se děje uvnitř živého organismu?

Life on a microscope slide

## Co se děje uvnitř živého organismu?

## Jak funguje skutečná neuronová síť?

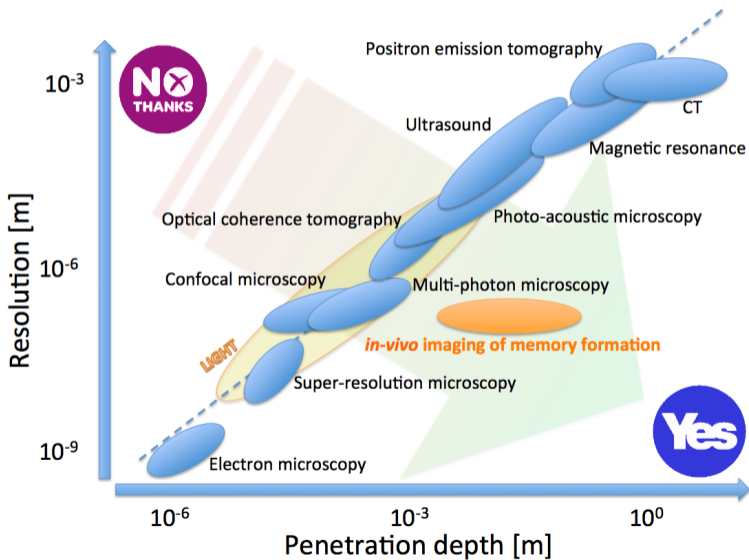

Co se děje uvnitř? **Zajímavé je schované**

## Co se děje uvnitř? **Zajímavé je schované**

a standard image guide    b single-mode image guide    c multi-mode fibre

**+ Interference**

## Obrátíme problém

- Propojuje vstup a výstup vlákna
- $181^2 \times 352^2$  complex float  $\Rightarrow$  32.5 GB
- vytváří mřížky pro prostorové modulátory
- naměřeno za 1.5 minuty
- zpracování LabVIEW  $\sim$  45 minut

**Nadřazené prostředí**  
vlastní správa paměti  
neví kolik má alokovat

×

**Knihovna**  
snadno alokuje  
kdy a jak uvolnit?

## Parametry ve vnějším bufferu

alokuje vnější prostředí

```
size_t parsize = dllParSize();
DLLPAR * params = malloc(parsize);
dllSetParam(params, par1, par2);
dllGetResultSize(params, & size);
res = malloc(size * sizeof(float));
dllCalculate(params, res);
```

## Vnitřní správa

knihovna se stará sama

```
int32_t ID = dllAllocCalculations();
dllSetParam(ID, par1, par2);
dllGetResultSize(ID, & size);
res = malloc(size * sizeof(float));
dllCalculate(ID, res);
```

```

- 3 funkce pro nas tavení a čtení parametrů
- 4 výpočetní funkce

# Testování a MATLAB

- standardní funkce

```
loadlibrary, calllib, unloadlibrary, libpointer
```

- MATLAB automaticky vytvoří rozhraní mezi pro volání funkcí

```
loadlibrary('libDll.so', 'header.h')
```

- Volání funkcí: calllib

```
[x1,...,xN] = calllib(libname,funcname,arg1,...,argN)
```

- Pro návrat do polí nutné použít libpointer

- Netriviální příprava struktur

- Komplexní čísla?

```

```

- Všechny funkce zaobalené do třídy
- Destruktor pro úklid
- Parametry přístupné přes vlastnosti

## Poznámky:

- pro znovunačtení knihovny  
clear functions
- row/column major vícerozměrná pole
- indexování od 0/1
- tic; toc

## Zobrazování vláknem

- Fluorescencní zobrazování hluboko v tkáních
- LabVIEW  $\Rightarrow$  C + CUDA alespoň 100 násobné zrychlení
- Další zobrazovací techniky: CARS, SGH
- Směřujeme k zobrazování pohybujících se modelů

## MATLAB pro debugování

- srovnání výsledků výpočtu knihovna  $\times$  MATLAB
- srovnání výkonnosti
- nutnost použít MEX (někdy)
- pravděpodobnost pádu MATLABu 99% (ze začátku)  $\Rightarrow$  20 %
